

Export and import process attachments

JRMover

Export process attachments from JobRouter to many different destinations. Alternatively, you can retrieve files from different sources and make them available in JobRouter processes. For each action, the source or target and the required credentials can be submitted.

Possible sources and destinations are JobRouter processes, directories, file servers, FTP servers and SSH shares. In addition, necessary directory structures can be created automatically during export and further file actions, such as renaming, can be carried out.

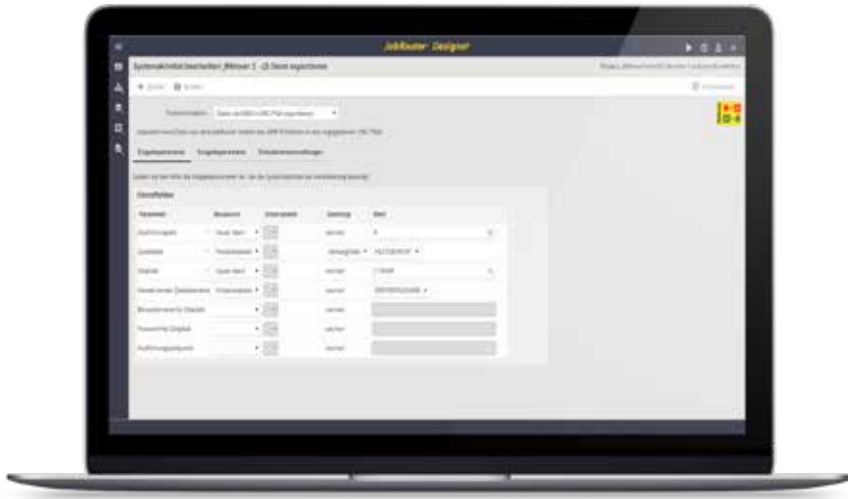

The integration into JobRouter processes takes place via the included JobActivity, which can be controlled with a system activity.

GOOD PROCESSES START WITH GREAT ADDONS.

JR-AddOns - The care series for your JobRouter!

Essential features

- Export and import attachments from and into incidents
- Create the necessary directory structures during export
- External targets and sources: File server, FTP server and SSH shares
- Configurable system activity for easy process integration
- Synchronous, asynchronous and time-controlled copying of files

The main application area of JRMover is solving special tasks around attachments. When it comes to distributing files to special directories or even external servers that require separate authentication, JRMover is the tool of choice.

Thanks to the internal API, our AddOn can be extended for special tasks. For example, it is also possible to store data in cloud storage services (OneDrive, GoogleDrive, Dropbox, etc.) on special request.

Simply contact us regarding your requirements. Together with you, our specialists will find a solution for your individual file export and/or import.

Do you already know our complete care series?
